Wednesday, 18 April 2018 08:32 -

[Body By Leverett](#) has proudly served Phoenix and Ahwatukee for 23 years, and is proud to offer non-surgical CoolSculpting as an alternative to surgical body contouring procedures. CoolSculpting is a safe, non-invasive procedure that works by freezing fat cells underneath the skin, which leaves the surrounding skin, muscle and tissue unharmed while effectively destroying fat cells. The fat cells are then metabolized by the body, leaving behind the slimmer figure that patients seek. Benefits of CoolSculpting include:

- *Reduces stubborn fatty deposits*
- *Non-surgical*
- *Non-invasive*
- *No needles, cuts or incisions*
- *Fast treatment*
- *No downtime, quick recovery*

Patients describe CoolSculpting as a comfortable procedure, and it requires no anesthetic or preparation. During the procedure, a special cooling applicator is placed on the area being treated. The applicator will apply some suction and cool temperatures, so you may feel a pinch or coldness. However, the initial cooling feeling dissipates within a few minutes, and you can expect to sit comfortably for the duration of the treatment. The treatment lasts for approximately 35 minutes but varies based on the target area being treated.

The CoolSculpting-certified staff at Body By Leverett can treat most areas of the body including the chin, bra bulges, fatty pockets underneath the buttocks, as well as unwanted fat in the abdomen, flanks, upper arms and inner and outer thighs.

Join us for our next CoolSculpting seminar Thursday, April 26, from 5:30 to 7 p.m. Learn about the technology and how the treatment works, view a live demonstration, win raffle prizes, Q&A session and mini consultations available. RSVP at <https://coolsculptingevent.eventbrite.com>.
